

In the past year, we tested **VitaPak-Dairy** at five dairy farms in the Southwest Wisconsin area. Below are their observations while using **VitaPak-Dairy**:

- ✓ Stronger estrus cycles
- ✓ Breedable sooner post calving
- ✓ More 1st service conceptions
- ✓ Fewer retained fetal membranes
- ✓ Greater tone to the uterus
- ✓ Fewer cystic ovaries
- ✓ Reduced uterine oedema
- ✓ Somatic cell counts are more stable from test to test
- ✓ Decrease in SCC in milk
- ✓ Received increase in premiums
- ✓ Udders are softer and scar tissue gradually disappears during lactation
- ✓ Increase in production persistence throughout lactation
- ✓ Fewer mastitis cases, less withhold of milk
- ✓ More consistent appetite
- ✓ Less foot problems caused by acidosis
- ✓ Improved health & resistance of the cow
- ✓ Reduced cull rate

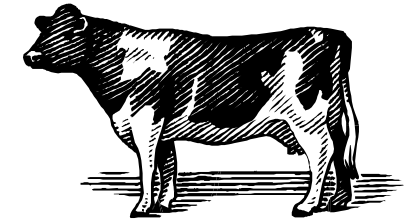

We also asked the following question:

Do you feel the benefits of **VitaPak-Dairy** are worth the 11¢ a day retail investment? They all said “yes” and to this day they are still using **VitaPak-Dairy**!

VitaPak-Dairy is a dry powder form of the highest quality first milking bovine colostrum available today. It contains only colostrum taken within six hours after birth of the calf and is processed from large pools of material obtained from a large population of dairy farms. Each contributing farm must meet rigid standards established by Immuno-Dynamics and all lots of product are tested to assure compliance. VitaPak production processes have been validated to retain maximum biological activity.

Benefits of Feeding **VitaPak-Dairy**

Estrus	May show timid signs of estrus 15-18 days post calving in herds that have been on VitaPak in previous lactation or have been on VitaPak during dry period.
	Stronger estrus cycles
	Breedable in 45 days
Post Calving	Fewer retained fetal membranes
	Greater uterine tone
	Reduced utter oedema when VitaPak fed prior to parturition.
	Fewer cystic ovaries
Lactation (7- 10 days)	Shed down of fibrin clots, cells and other debris (cell counts may go up for 1-2 milkings)
30-45 days	Reduction in SCC's and more stable counts from test to test
	Increased production persistence
	Softer udders
	Scar tissue in udders gradually disappears during lactation when fed continually
	Fewer mastitis cases, decreased loss in marketable milk
	Decreased acidity of milk
Overall	Reduced cull rate
	Improved health & resistance of the cow
	More consistent appetite
	Less affected by climatic changes, especially heat
	Less foot problems caused by acidosis
	No additional nutritive requirements

Using VitaPak

Adult dairy cows are started on a conditioning 12 grams daily feeding added to the diet for a period of 14 consecutive days. The daily feeding is then reduced to 6 grams added to the ration and continually fed throughout lactation, the dry period and gestation for maximum effectiveness in reducing disease incidence and severity.

The VitaPak Advantage

- Reduced drug residue
- Low cost natural product
- Enhanced natural resistance to disease
- Healthier Cows
- Improved production

Getting started

VitaPak-Dairy is available in convenient quantities to suit the needs of any size herd. To learn more about VitaPak-Dairy or to find out how to purchase call:
